

# STANDARD DEVELOPMENT PIPELINE

---

This document defines the standard workflow every developer must follow when building any product feature. The goal is to ensure consistency, quality, and reliable production releases.

## OVERVIEW

All features must pass through the following pipeline stages:

F0 → F1 → F2 → F3 → F4 → F5 → F6 → F7 → F8

No feature is allowed to skip any stage.

### F0 — Problem Definition

Define:

- What problem is being solved
- Who is affected
- Why it matters

Output:

- Clear problem statement

### F1 — Specification

Define exactly how the feature works:

- Inputs and outputs
- UI behavior
- Edge cases

Output:

- Clear written specification

## **F2 — Task Breakdown**

Break feature into tasks:

Each task must include:

- Title
- Description
- Acceptance criteria

Create GitHub Issues for each task.

## **F3 — Development**

- Create a feature branch from develop
- Work only in that branch
- Follow coding standards
- Stay within scope

Example:

feature/checkout-flow

## **F4 — Self-QA**

Before creating a PR, developer must:

- Test feature end-to-end
- Handle edge cases
- Ensure no crashes
- Ensure no console errors
- Confirm mobile responsiveness

## **F5 — PR Review (Quality Gate 1)**

- Open PR from feature → develop
- Must be reviewed and approved
- Fix all comments before merge

No self-merging allowed.

## **F6 — Integration Testing**

- Feature tested within full system
- Ensure no conflicts with other features
- Verify data consistency

## **F7 — Staging Validation (Quality Gate 2)**

- Merge develop → staging
- Test full user flows
- Test on real devices
- Check performance

## **F8 — Production Release**

- Merge staging → main
- Final approval required
- No critical bugs allowed

Feature goes live.

## **QUALITY GATES**

All features must pass:

1. PR Review
2. Staging Validation
3. Production Approval

## **RULES**

- No direct commits to main or staging
- Always use feature branches
- Always create PRs
- Always test before pushing
- Always follow the pipeline

## **TEAM EXPECTATION**

Every developer must:

- Know the current stage of their feature
- Follow the pipeline strictly
- Communicate blockers early
- Deliver clean, tested work
